No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                     ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                      R73685-876 are potential peptide binders of HLA-A2.1 motif. Using motifs disclosed in the invention, these peptides were screened for further motifs. Only peptides with binding affinity of at least 1% (binding affinity is expressed as an IC50 value) as compared to the standard peptide (R71293) in assays. This peptide has an binding value of 0.1500. The peptides of the invention can induce cytotoxic T lymphocytes which can react with target cells. They can be used for the treatment or prophlyaxis of cancer, eg. prostate cancer or

The peptide corresponds to amino acids 369-377 of human Her-2/Neu protein. CTL-activating peptides can be used in a vaccine for protecting against tumour cell formation. CTLs activated by the peptides will lyse tumour cells displaying specific peptides. Antibodies against CTL-activating peptides are useful for the identification of other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         In vivo activation of tumour-specific cytotoxic T lymphocytes - by contacting with polypeptide(s) derived from human p53 or Her-2/Neu
                                                                   Immunogenic peptide(s) having an HLA-A2.1 binding motif - used for treatment or prophylaxis of cancer, virus infection or autoimmune diseases.

Synthetic peptides W36824-40 are based on the sequence of the human Her-2/neu protein, wherein each sequence contains the anchor motif for man leukocyte antigen (HLA) A2.1. The present peptide 1s based on positions 369-377. The ability of these peptides to inhibit the binding of an influenza virus matrix protein peptide M1 to HLA A2.1 was measured by inhibition of lysis by an M1 specific, HLA A2.1 restricted, cytotoxic T lymphocyte (CTL) clone. The present protein showed 38% inhibition. The peptides were also tested for their ability to elicit an immune rosponse this will always to the tested for their and M7 (W36826) were able to do this. H3 and H7 peptides are tumour-associated antigens, and were used to immunize a transgenic, non-human vertebrate (that has been modified to express at least one HLA antigen), so that the annal protein the contains th
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Her-2/neu protein; human leukocyte antigen A2.1; HLA;
cytotoxic T lymphocyte; CTL; immune response; tumour-associated antigen;
T-cell receptor; TCR; tumour treatment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         manner. Cells expressing recombinant TCR are used to identify antigens associated with a tumour and to treat tumours in humans. Transgenic mice are a more convenient source of CTL than the tumour-infiltrating lymphocytes previously used. TCR can be humanised to reduce
similar compounds which may be useful for treating cancer or virally-infected cells, or for diagnosis. The peptide and vaccines produced provide immunity to a high percentage of different ethnic groups, i.e. those with different HIA alleles.
                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Nucleic acid encoding variable regions of HLA-restricted non-human \tau cell receptor specific for tumour antigen - used to identify tumour antigens and for tumour therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  chains of such TCRs can be amplified from CTLs produced in the above
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              displays HLA-restricted T-cell receptor (TCR) specificity for the antigen. microparticle preparation (MP) has been developed, consisting of microparticles having a diameter of less than 100 mu m. The MP comprises:

(a) a polymeric matrix (PM) consisting of one or more synthetic polymers to a botymeric matrix (PM) consisting of one or more synthetic polymers consisting a solubility in water of less that 1 mg/1; and (b) an expression vector selected from RNA molecules (at least 50% of which are closed circles) or circular plasmid DNA (at least 50% of which are supercoiled).

Also described is a MP of at most 20 microns in diameter, comprising: (a) can PW: and (b) a NAM comprising an expression control sequence operatively linked to a coding sequence, where the coding sequence encodes an captession product selected from: (1) a polypeptide at least 7 amino cacids in length, having a sequence identical to the sequence of: (1) a fragment of a naturally-occurring mammalian protein: or (ii) a fragment of a naturally-occurring alength and sequence which permits it to cameman; (2) a peptide having a length and sequence which permits it to bind to an MHC class I or II molecule; and (3) the polypeptide or the peptide linked to a trafficking sequence. W69763 to W69765, and W78793 cow W78879 are peptide fragments for use in the present invention. The CMPS are highly effective vehicles for the delivery of polynucleotides incompany of polynucleotides incompany of permits in the present incompany of car incompany of the captering of the captering sequence. The time of the captering of
                                                                                                                                                                                                                       Microparticle; delivery; polymeric matrix; autoantigen; tumour antigen; class II associated peptide; pathogen; gene therapy; genetic disease; infection; downregulation; immune response.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New preparations of microparticles - comprising a synthetic polymer matrix and nucleic acid comprising an expression vector for use in

These peptides are are cysteinedepleted mutants of a native disease-specific CTL epitope. The cysteinedepleted CTL epitopes elicit a stronger or more specific CTL response than the native epitope. The epitopes can be used in a disease-specific timunogen to protect a mammal against disease in particular melanomas. The peptides may also be used to screen a sample for the presence of an antigen with the same epitope, or with a different cross-reactive
side-reactions and short peptide derivatives of TCR are more economical to produce than TCR itself, particularly when expressed as a single-chain molecule rather than as a dimer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequences shown in W70053 to W70075 represent peptides derived from HER-2/neu (cerB-2) antigen. The peptides can bind to a human leukocyte antigen (HLA), HLA-A1. and are used to axemplify the method of invention of producing antigen-specific cytotoxic T cells (CTLs) in vitro. The method comprises contacting immunogenic peptides from an antigen that binds class I major histocompatibility complex (HHC) molecules with antigen presenting cells (APC) pretreated with presence of at least 2 incubating the APCs with purified CDB cells in the presence of at least 2 incubation growth factors, thereby producing antigen-specific CTLs. A method for specifically killing target cells in a human patient is also provided which comprises obtaining a fluid sample containing CTLs from a patient, contacting the cytocxic T cells with APCs pretreated with pre-treatment growth factors, where the APCs comprise class I MHC molecules. The pretreated APCs are incubated with the cytotoxic growth factors, thereby producing activated CTLs which are contacted with a carrier to form a composition. The composition can then be administered to the patient. The activated CTLs can be used for treating cancers, immune disorders, viral infections, the contains or the contacted infection, fungal infection, malaria or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Region
                                                                                                                                                                                                                           Region
                                                                                                                                                                                                                                                                        Region
                                                                                                                                                                                                                                                                                                                                                               Region
    The present invention relates to a new pharmaceutical composition comprising a unit dose form of a peptide, or analogue, comprising an explosed from those represented by peptides Y98812-799339 which are derived from those representative by peptides Y98812-799339 which are derived from various antigens of the world wide population. The class DR molecules, representative of the world wide population. The class DR molecules, representative of the world wide population. The class DR molecules, representative of the world wide population. The class DR molecules, representative of the world wide population. The peptide contained at an IC-50 of less than or equal to 1,000 nM. The pharmaceutical focuses the immune response than or equal to 1,000 nM. The pharmaceutical focuses the immune response contained therefore be used in cases of chronic viral diseases and cancer. Examples of diseases that can be treated using the peptide containing pharmaceutical include autoimmune containing the peptides of diseases that can be created using the peptide epitopes. Jyme disease, hepatitis, construction allorgists, lyme disease, hepatitis, construction and produced diseases which can be treated using immunogens administered with the peptides prostate cancer, hepatitis by hepatitis C, AIDS, renal carcinoma, cervical carcinoma, lymphoma, and condytoma acuminatum. The peptides may also be useful as diagnostic or therapeutic agents. The peptides may also be useful as diagnostic conserved to make monoclonal antibodies useful as potential diagnostic conserved to make monoclonal antibodies useful as petides may be used to predict which the readents. for example, to determine the susceptibility of an individuals will be at substantial risk of developing chronic infection. The selection of appropriater T and B cell epitopes should allow the conserved epitopes of pathogens which are characterized by high sequence conserved epitopes and malaria.

HER2 extracellular domain used as vaccine - comprises sequence of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    portions of the HER2 mol. The protein is antigenic in animals. Fragment comprising at least 9 amino acids open several possibilities for further research and a broad range of potential therapeutic apilications, e.g. for the treatment of mammmary gland adenocarcinoma and other cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This claimed sequence is free of transmembrane or intracellular

It is the expression product of a nucleic acid molecule (T72755) prepd. by PCR amplification of Her2 cDNA from a breast cancer cell line and fusion to GM-CSF cDNA. Fusion expression vectors can be used to transfect mammallan and insect cells. The Her2-CM-CSF fusion protein is used to generate anti-Her2 immunity. Tumour cells are eliminated by cytotoxic T lymphocytes activated in vivo or in vitro by exposure to antigen-presenting cells exposed to the

The patent discloses heterominibodies which are multifunctional compounds produceable in a mammalian host cell as a secretable and fully functional heterodimer of two polypeptide chains, where one of the polypeptide chains comprises, a CHI-domain (constant domain of an immunoglobulin heavy chain) and the other chain comprises CL-domain (constant domain of an immunoglobulin light chain). The polypeptide chains further comprise,

                                                                                                                                                                                                                                                                                                                                                                      ö
fused to the constant domains at least two (poly)peptides having different receptor or ilgand functions, where further at least two of the different (poly)peptides lack an intrinsic affinity for one another and are linked via the constant domains. The heterominibodies have cytostatic, immunostimulatory, antileukaemia and antiproliferative activities. These compounds can be used for diagnosing, preventing and treating malignant cell growth related to malignancies of haematopoietic cells e.g. lymphomas and leukaemias, or to solid tumours e.g. carcinomas, melanomas and sarcomas.
                                                                                                                                The present sequence is a fusion protein comprising DC8 single-chain FV (scFV) fragment at the N-terminus, extracellular domain of human erbB2 at the C-terminus and a tetramerisation of main erbB2 at the C-terminus and a tetramerisation on an interpretation domain characterised in bacterial expression system is applicable for expression of fully functional and secretable recombinant protein in mammalian host cells. This tetrameric construct was not expressed as secretable and fully functional protein in mammalian cells. Hence general applicability of the tetramerisation domain for oligomerisation strategies in mammalian cells was ruled out.
                                                                                                                                                                                                                                                                                                                                                                        Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence represents the human HER-2/neu oncogene protein. A fragment of this protein is used in a method for eliciting or enhancing an immune response to HER-2/neu protein. The polypeptide can stimulate T cells and B cells to produce an immune response to the HER-2/neu protein. The method can be used for immunisation against a malignancy in which the HER-2/neu oncogene is associated and in the treatment of an existing
                                                                                                                                                                                                                                                                                       Gaps
Human HER-2/neu protein (W01111), also called p185 or c-erbb2, is the product of the HER-2/neo oncogene (see also 740739). The protein is over-expressed in various cancers, including breast, over-expressed in various cancers, including breast, over-expressed in various cancers, including breast, protein can be used to immunise an animal against a malignancy with which the oncogene is associated. The polypeptide can be produced in transformed host cells for use in immunisation. Alternatively, animal cells are transfected in vivo or ex vivo with a viral vector that directs expression of the polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ដូ

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents a SPLICE erbB-2 receptor protein. The protein has an in-frame deletion of 16 amino acids, 2 of which are conserved cysteine residues, compared to the unspliced protein. The erbB-2 polynucleotide is used to construct probes for detecting disorders of cell transformation such as cancer. Antibodies to the protein may be used to detect SPLICE erbB-2 in a sample. Agents protein may be used to detect SPLICE erbB-2 in a sample. Agents protein may be used to detect SPLICE erbB-2 in a sample. Agents sPLICE erbB-2 are useful for reducing tumor cell proliferation and treating cancer. Substances which stimulate SPLICE erbB-2 are useful for treating conditions involving damaged cells including conditions in which degeneration of tissue occurs, such as arthropathy, bone resorption, inflammatory diseases, degenerative disorders of the central nervous system and wound healing.
                                                                                                                                                                                                                                                                                                                                                                               SPLICE erbB-2 receptor protein; cell transformation disorder; cancer; tumor cell proliferation; tissue degeneration; arthropathy; bone resorption; inflammatory disease; degenerative disorder;

Her2 can be used in the claimed method as an autovaccine to induce a CTL Her2 can be used in the claimed method as an autovaccine to induce a CTL Her2 can be used in the claimed method as an autovaccine to induce a CTL response. Subdominant CTL epitopes, antibody binding regions and cysteine residues involved in disulfiable bonds are preserved in the immunogenized forms. Regions suitable for the insertion of foreign T complete epitopes were identified (see features table). The method complete method is used for inducing immune responses against weakly immunogenic cell-associated peptide antigens (PSM) such as those associated with concers (self-proteins), e.g. human prostate specific membrane antigen (PSM), heregulin 2 (Her2) and/or fibroblast growth factor 8b (FGF8b). The method comprises effecting simulateneous presentation by antigen (PSM), heregulin 2 (Her2) and/or fibroblast growth factor 8b (FGF8b). The method comprises effecting simulateneous presentation by antigen compression of the animal immune system of: (1) at least 1 compression from the cell-associated PA; and (2) at least 1 compact of all group which is foreign to the animal. Analogues of first T helper cell group which is foreign to the animal. Analogues of first T helper cell group which is foreign to the animal associated comprising a substantial cart of all known and predicted cyt and becall epitopes of the respective companies to breast cancer when the Da is human beta by human personate of producted cyteled prostate, prostate chreat prostate, and human personate of the pass to the respective companies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Steinaa L, Mouritsen S, Nielsen KG, Haaning J, Leach D, Dalum I;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 18,

Patent No. 5846538

GENERAL INFORMATION:
APPLICANT: Cheever, Martin A.
APPLICANT: Disis, Mary L.
TITLE OF INVENTION: FOR DIAGNOSTS AND TREATMENT OF MALIGNANCIES IN WHICH THE TITLE OF INVENTION: HER-2/neu ONCOGENE IS ASSOCIATED
NUMBER OF SEQUENCES: 69 - CONFESSIONDENCE Seed and Berry LLP
STREET: 6300 Columbia Center, 701 Fifth Avenue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Length 9;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 62, Application US/08486348A
Petent No. 5846538
GENERAL INFORMATION:
APPLICANT: Cheever, Martin A.
APPLICANT: Cheever, Mary L.
TITLE OF INVENTION: IMMUNE REACTIVITY TO HER-2/neu PROTEIN
TITLE OF INVENTION: FOR DIAGNOSIS AND TREATMENT OF MALIGNANCIES IN WHICH THE
TITLE OF INVENTION: HER-2/neu ONCOGENE IS ASSOCIATED
NUMBER OF SEQUENCES:
ADDRESSEE: Seed and Berry LLP
STRREET: 6300 Columbia Center, 701 Fifth Avenue
CITY: Seattle
STATE: Washington
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

summaries

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

RATELER membrane protein RFL040w - yeast (Saccharomyces cerevisiae)

N.Alternate names: protein R004

C. Decession: Sc6125, S60496

C. Accession: S66125, S60496

R. Murakani, Y.; Natloo, M.; Sasanuma, S.1.; Sas submitted to the EMBL. Data inherary, May 1959

A. Accession: S66125, S60496

                                                                                                                                                                                                                                                                                                                                                                     ACTIVATION.

-1 SUBUNIT: ANTIPARALLEL HOMODIMER.

-1 ALTERNATIVE PRODUCTS: 2 ISOFORMS; CGK1-ALPHA (Q13976) AND CGK1-BETA (SHOWN HERE); ARE PRODUCED BY ALTERNATIVE SPLICING.

-1 MISCELLANGOUS: EXHIBIT A SUBSTRATE SPECIFICITY SIMILAR BUT NOT IDENTICAL TO THAT OF CAK.

-1 SIMILARITY: BELONGS TO THE SER/THR FAMILY OF PROTEIN KINASES.

-2 GMP SUBFAMILY.

-3 CGMP SUBFAMILY.

CGMP-DEPENDENT PROFEIN KINASE 1, BETA ISOZYME (EC 2.7.1.37) (CGK 1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      J. BLOIL. Chem. 274:8391-8404(1999).
-1- CATALYTIC ACTIVITY: ATP + A PROTEIN = ADP + A PHOSPHOPROTEIN.
-1- ENZYME REGULEATION: BINDING OF CGMP TO CGK RESULTS IN ENZYME
ACTIVATION (BY SIMILARRIY).
-1- SUBUNT: ANTIPARALEL HOMODIMER (BY SIMILARITY).
-1- ALTERNATIVE PRODUCTS: 2 ISOFORMS; CGK1-ALPHA AND CGK1-BETA (SHOWN HERE); ARE PRODUCED BY ALTERNATIVE SPLICING.
-1- MISCELLANBOUS: EXHIBIT A SUBSTRATE SPECIFICITY SIMILAR BUT NOT IDENTICAL TO THAT OF CARK (BY SIMILARITY).
-1- SIMILARITY: BELONGS TO THE SER/THR FAMILY OF PROTEIN KINASES.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Eukaryota; Metazoa; Chordata; Cranlata; Vertebrata; Euteleostoml;
